

Machinery for the processing of carrots

Dofra has various machines in its product range for peeling and processing carrots. The heart of our processing lines is formed by our revolver drum peeler and our blade peeler. We also have a universal cutter in our range which allows you to cut chopped, baton and julienne carrots.

Revolver drum peeler RDP-2500

The continue peeler for industrial use has a processing capacity of approximately 1,200 kilograms per hour. The machine sets itself apart from other machines because it has more scraper rollers and the 2 mm gap between the rollers is much smaller than in the customary machines. This creates an effective scraping surface that is evenly distributed when in contact with the carrot and therefore results in an optimum and evenly peeled product.

The rotating drum prevents the product from becoming stationary and only being scraped on one side. Scraper rollers can be removed within approximately 30 seconds, which means that they can be cleaned and maintained quickly and easily. Further maintenance savings are also possible because the drum not belt-driven. This machine is also suitable for peeling baby new potatoes.

Knife peeler for carrots

The CPM-6000 has been developed for peeling elongated products such as carrots. The product is fed in manually. The product throughput speed and the blade pressure are infinitely adjustable. The machine has a capacity of approximately 4.000 to 4.500 units per hour and the peeling results are comparable with the results obtained by hand peeling.

Processing lines

High-quality peeling and processing machines form the heart of our processing lines. Our in-depth knowledge about carrot processing allows us to provide you with an excellent service for designing, configuring and installing your carrot processing line. All parts of the carrot processing lines are manufactured by us in-house. We also have sophisticated machines for waste transportation, sorting, de-stoning, dosing, inspection and weighing/packing potatoes.
